

Hossein Esmailzadeh

Infrastructure Engineer

Infrastructure Engineer with hands-on production experience designing, automating, and operating Linux infrastructure across virtualization, container platforms, and CI/CD environments. Skilled in Infrastructure-as-Code and configuration automation. Strong background in Linux systems administration, storage, and self-hosted infrastructure. Experienced in monitoring and observability with a foundation in system hardening and security practices. Mentor engineers through structured training on Linux, Containers, Kubernetes, CI/CD, and Cloud Infrastructure.

Experiences

Sina Communication Systems Co
DevOps Engineer
Aug 2024 – Present

Full-time
On-site

- Design, maintain, and troubleshoot Jenkins CI/CD pipelines supporting production software delivery.
- Provision and maintain build agents and virtual machines for reliable build and deployment workflows.
- Monitor production microservices using Prometheus and Grafana to improve operational visibility.
- Apply basic system hardening practices

Devonix Team
DevOps Mentoring
Jun 2025 – Jan 2026

Weekly Meeting
Remote

- Teach The Linux Command Line (LPIC-1) fundamentals
- Lead Docker Deep Dive sessions on containers and core Linux concepts
- Cover The Kubernetes Book for container orchestration
- Demonstrate GitHub Actions / GitLab CI runners and pipelines
- Introduce monitoring with Prometheus and Grafana
- Cover Cloud fundamentals (AWS / GCP)

Self-employed

Hybrid
Remote

- NixOS System Administrator**
Sep 2023 – May 2025
 - Write and manage custom Nix packages and overlays
 - Configure boot-time specialization and setup
 - Manage multiple profile-based configurations
 - Create and manage isolated test, deploy, and development environments
- DevOps Engineer**
Apr 2022 – Jul 2024
 - Deploy RESTful web apps with Docker Compose and Kubernetes
 - Configure custom Nginx load balancer
 - Set up Redis cache storage
 - Manage persistent storage volumes
- Linux System Administrator**
Sep 2020 – Apr 2022
 - Set up web servers (e.g. Nginx, Apache) on various Linux hosts
 - Set up Git and SMTP/IMAP servers
 - Troubleshoot system and package manager issues
 - Write custom services

RPS Cloud
Automation and Virtualization Specialist
Jun 2022 – Sep 2022

Hybrid
Remote

- Manage multi-node (clustering) Proxmox hypervisor
- Configure port forwarding using iptables
- Automate shell scripts to interact with Proxmox's API

Devonix Team
DevOps Mentoring
Sep 2021 – Aug 2022

Weekly Meeting
Remote

- Teach LPIC-1 fundamentals (basic Linux knowledge)
- Lead Docker Deep Dive sessions on containers and deeper Linux concepts
- Cover Kubernetes in Action for container orchestration
- Demonstrate Pipeline as Code, CI/CD pipelines and the Jenkins cookbook

Interests

Open Source Infrastructure

Linux Systems

Self-hosting

Automation

Achievements

Self-hosted Infrastructure

- Designed and operate a personal platform including Gitea, Nexus, HAProxy, and a Void Linux mirror.

Technical Mentoring

- Delivered recurring Linux, Kubernetes, Docker, and CI/CD mentoring sessions.

Infrastructure Automation

- Developed multiple CLI tools in Go and Perl for Git workflows, virtualization, and automation.

Projects

REST API Web App with Database and Cache

- Build a RESTful web app in Go
- Deploy MySQL with secret management in a Kubernetes cluster
- Configure Redis cache with autoscaling based on CPU usage and ConfigMap
- Provision persistent storage via file-based volumes

HAProxy Load Balancing and Proxy

- Configure SSL/TLS with HTTP-to-HTTPS redirection
- Route TCP traffic at the packet level
- Serve a fallback maintenance page when the main site is unavailable
- Support both reverse and forward proxying

VoidLinux Mirror Repository

- Build a custom Go web server optimized for performance and navigation
- Automate mirror syncing with a custom Perl script
- Schedule periodic syncing via cron
- Isolate the environment using Podman Compose

Sonatype Nexus Registry Setup

- Host multiple Linux distribution repositories as a caching server (Debian, Fedora, Void)
- Configure RAW registries for Flutter, Go, and Lua
- Set up Python, NPM, and Maven registries

Personal Gitea Instance

- Deploy a self-hosted Git platform using rootless Podman Compose for secure, daemon-free container management.
- Persist Gitea data in a PostgreSQL database
- Configure multiple CI/CD action runners

QEMU VM Management CLI

- Wrap a Type-2 QEMU hypervisor with KVM acceleration
- Support shared folders via NFS and 9p
- Configure boot-time port forwarding
- Enable headless VNC access with authentication

Git Tooling Suite

- Manage bare Git repositories with per-branch worktrees and bulk actions across worktrees
- Handle per-repo GPG keys, commit templates, and SSH key settings
- Edit Gerrit manifest files, add/remove/edit projects and remotes, via a simple TUI

Automated Resume Generation Template

- Store resume data in YAML with LaTeX/Typst PDF and Go-template HTML backends
- Automate build and publish via GitLab CI, triggered only on new tags

FreeBSD & OpenBSD Systems Administration

- Deploy and manage a FreeBSD VM (QEMU) running isolated Jails for web servers and applications
- Configure ZFS storage pools for the FreeBSD Jails environment
- Contribute configuration and maintenance support to run OpenBSD server hosting IRC, Git, web archive, and DevDocs services

Air-Gapped Debian Server Management

- Fully offline Debian environment inside a QEMU VM using the complete ~15GB DVD ISO set
- Configure apt to resolve packages entirely from local DVD-based repositories
- Deploy a bare-metal LAMP stack (Apache, MariaDB).
